ABSTRACTED-PUB-NO: TW 209260A

BASIC-ABSTRACT: Appts. for napping a cloth comprises a cylinder roller made of a stone, or a cylinder roller enclosed by an abrasive cloth and rotated according to a predetermined direction of an axle; a pressed body close to the cylinder roller, the upper portion of the pressed body having a corresp. matching device which is matched with the cylinder roller, has camber recesses intermeshing the cylinder roller. The cloth passes through the area between the cylinder roller and the pressed body while the cylinder roller is rotated, then water pressure is applied from the corresp. camber recesses of the pressed body so that the cloth is pressed and connected to the outer periphery of the cylinder roller.

ABSTRACTED-PUB-NO: US 5459911A

EQUIVALENT-ABSTRACTS: A method of raising cloth fibres at a surface of a cloth includes the steps of conveying a length of cloth to be treated through a space between a working rotary member e.g. grindstone or sanding member and a pressure contact member with a circular arc shaped concave surface so as to engage the cloth therebetween and applying a pressure via the pressure contact member to the cloth to bring it into close contact with the peripheral surface of the working member.

USE - Raising fibres on surface of cloth.

ADVANTAGE - Gives thickly formed short fluff without heating  
of cloth, more  
uniform treatment.
